

Hello everyone and Happy New Year!

The trout are well into their “fry” stage now and will be for some time. There was A LOT of growth over the two week winter break and as of today most of the fry are two inches long; so, they went from egg to two inches in roughly 3 months. The students and I suspect that the trout will be between 4 -5 inches by May 1st, the day of our stocking field trip. The total number of trout the students counted is 40 in both tanks combined. 40 small trout in 110 gallons of water equals plenty of space to move around and grow. The water is crystal clear and all chemical levels are stable according to the students who did our most recent water test. Stay tuned for pictures of the fry that will be posted in the near future.

-Mr. C.
